

# Save now. Find it later.

A practical marketing package for a free local Mac app.

A little robot for the  
useful bits of your day.

**The robot earns attention.  
The workflow earns the download.**

Let DaBin guide viewers around the actual Mac interface, from saving a reference to finding it again and planning the next task.

## Start with designers.

Give creative freelancers one clear example: save a reference image, a useful link and an idea into a fictional project. Then find one again. Expand to students and developers after the first week of feedback.

**This kit is prepared locally.** Day 1 starts only when DaBin is publicly downloadable in the intended App Store territories. Complete the real app URL, website and contact fields before publication. Outreach, posts and Apple nominations remain unsent drafts.

**Compatibility:** Apple Silicon Macs, macOS 14 or later.

**Product basis:** submission-pack 0.4.31 (86); not evidence of App Store approval.

**Inside the ZIP:** launch plan, editable copy, graphics, films, landing page and sources.

# One useful promise.

A concrete outcome should be visible before you list features.

**Primary message:** Save now. Find it later. Keep it on your Mac.

## DESIGNERS / START HERE

Collect a reference image, a link, a note and a next task in the fictional Studio Refresh project. Show the real Projects view.

## STUDENTS / TEST IN WEEK THREE

Keep fictional lecture screenshots and reading notes together. Find a word in supported content saved into DaBin. Avoid promises about grades or study performance.

## DEVELOPERS / TEST IN WEEK THREE

Save a documentation link, a named snippet and the next step with a project. Do not imply code execution, AI answers or unshipped integrations.

## Why people should try it

A visible desktop drop target makes capture approachable. A local board keeps useful saved content and project resources close. No account is required, so the first demonstration can get straight to saving and finding.

**Privacy wording:** No account, ads, analytics or cloud sync. Saved captures and recognized text stay on this Mac. Optional manual-link previews can contact websites. Use specific facts, not an absolute promise that nothing ever leaves the computer.

# Three demonstrations.

Use fictional sample content. Keep the interface readable and the benefit specific.

## 1. Feed DaBin / guided UI tour

DaBin explains the actual native interface with conversational speech, a synced mouth, attentive gaze and pointer guidance. Before/after states show capture, projects, search and tasks; the tour also introduces optional capture, export and recovery.

**Files:** 04\_Video contains landscape, portrait and silent exports, audio and a subtitle sidecar. Watch the final film with sound and muted. Verify crops and subtitles before publication.

## 2. Where did that screenshot go?

Use a neutral filename and put the word terracotta inside a fictional saved screenshot. Record an actual DaBin search returning that word, then open the saved result. Search is local and covers supported content saved into DaBin.

## 3. One project, useful bits together

Show the fictional Studio Refresh project with an image, link, note and task. Organization is optional: save first, sort when it helps. Student and developer examples reuse the same workflow.

## Outcome-led App Store screenshots

Catch the useful bits.

Keep a project together.

Give one task attention.

These are real source screenshots. Compare them with the distributed build. A saved-screenshot search image is an additional proposed capture; do not present a composed mockup as proof of actual search.

**Apple preview distinction:** This guided UI tour uses native fixture views and composed pointer actions. Apple app previews use device-captured footage; make and validate a separate recording if an App Store preview is wanted.

# Make the launch concrete.

A complete release and working destination links matter more than a chosen calendar date.

## Before publication

- Verify the final distributed app and actual Free price in the intended territories. This kit does not establish approval or availability.
  - Complete the App Store URL, public website, support and contact details. Replace every bracketed field.
  - Compare screenshots and demonstrations against the public build. Hide personal captures, notifications and private project material.
  - Watch video exports with sound and muted; check subtitle accuracy, crop, text and compatibility.
- 

## Before each channel goes live

- Read the current r/macapps rules and account eligibility. Complete its required developer/AI disclosure and respect promotion timing.
  - Use a personal Product Hunt maker identity, an accurate gallery and a staffed launch day. Ask for comments and questions, never upvotes.
  - Read a recipient's recent work yourself and use the official contact route. Tailor one short message; no bulk distribution.
- 

## Apple featuring

If the launch is still ahead, Apple recommends submitting plans at least three weeks early where practical. The draft in 02\_Copy maps the real product into a launch nomination. If already public, nominate only an actual future meaningful update with an accurate date.

A nomination is editorial consideration. Do not publish Apple featuring or award claims unless selection is documented. Accessibility statements must match an evaluation of the exact shipping build.

# A month of useful stories.

The full editable daily plan is [01\\_Launch\\_Playbook/30\\_Day\\_Calendar.html](#) and [.json](#).

## DAYS 1-7 / LAUNCH

Verify public availability, publish one main clip and one rule-compliant Mac community post, answer questions and pitch the first three relevant targets.

## DAYS 8-14 / SEARCH

Show the real saved-screenshot text-search trick. Prepare or run Product Hunt when ready. Tailor two more pitches; follow up once where welcome.

## DAYS 15-21 / AUDIENCE TESTS

Try a student example, then a developer example. Answer an actual question with a short clip. Contact two more relevant targets.

## DAYS 22-30 / LEARN AND REFRESH

Reach ten selected pitches only if fit warrants it. Publish the project demo, share any actual coverage, review results and choose the next audience and hook.

## Keep the effort manageable

Plan for 30-45 minutes on publishing days, a brief daily reply check in launch week and a 45-minute weekly review. Start with organic channels and existing accounts. Paid partnerships are optional later, with a deliberate capped budget.

Calendar days can move to match readiness. This plan is not a scheduled automation. Do not repeat a subreddit promotion before the current cooldown allows it.

# Ten routes to investigate.

Official routes checked 4 October 2026. Priority and fit are marketing judgments, not confirmed interest.

| Target / route                                                                  | A useful angle                                                 |
|---------------------------------------------------------------------------------|----------------------------------------------------------------|
| <b>MacStories</b><br>Official team email links on About page                    | Native Mac capture/search workflow. Offer independent testing. |
| <b>The Sweet Setup</b><br>Contact-page email link or official social account    | Creative references and calm project organization.             |
| <b>The Mac Observer</b><br>Contact us form; subject Suggestion for an article   | Concrete free Mac utility with saved-content search.           |
| <b>TidBITS</b><br>Publisher contact on official Contact page                    | Personally edited pitch after reading the publisher's guide.   |
| <b>Created Tech</b><br>Official contact form                                    | Fictional design-reference project; check current activity.    |
| <b>9to5Mac</b><br>News Tips email link on official Contact page                 | Concise Mac launch facts and real app views.                   |
| <b>MacRumors</b><br>Official tips address on About page                         | Practical Mac-app discovery; coverage is uncertain.            |
| <b>MacSparky / David Sparks</b><br>To Reach David address on current About page | A short Apple productivity note, clear subject and workflow.   |
| <b>Better Creating</b><br>Official partnerships form/email                      | Optional paid/feature inquiry: fit, rates and rights first.    |
| <b>Jeff Su</b><br>Start a partnership link on official Partnerships page        | Optional paid partnership inquiry; no booking assumed.         |

**Skip MacMost:** its official contact page explicitly rejects product-review and marketing requests. TidBITS rejects press releases; use only a personally considered pitch. Outreach drafts remain unsent, and paid routes require a budget choice.

# A few words that work.

Full platform drafts, outreach, press material, store fields and replies are in 02\_Copy.

## SHORT LAUNCH POST

Meet DaBin: a little robot for the useful bits of your day.

Save notes, links, images, files and tasks on your Mac - then find them again.

**Free. No account. Apple Silicon, macOS 14+.**

Add the real App Store link.

## SCREENSHOT SEARCH POST

Where did that screenshot go?

Save it into DaBin, then find a word inside it with local text search.

**Free for Apple Silicon Macs, macOS 14+.**

Attach the real saved-screenshot search demonstration.

## CREATOR PITCH CORE

DaBin is a free local Mac app with a robot drop target. The short demo saves fictional project references, then shows how to find a word inside a saved screenshot. Give the public app and demo links, add a truthful reason for the recipient's fit, and invite an independent opinion.

## Match the destination

Reddit needs the required structured developer format and honest AI disclosure. Product Hunt needs a clear tagline, actual gallery and a maker comment. The press release is conditional on publication. App Store listing copy avoids price promises and competitor keywords.

No founder origin story, download count, testimonial or endorsement is invented. The question "Why is it free?" needs the owner's real answer.

# Learn without app telemetry.

Use Apple campaign reports when available, platform reach and voluntary workflow feedback.

## Record one row per channel and asset

Log the publication time, campaign token, actual Apple-generated URL, audience, asset, minutes spent and comparable reporting dates. Record views, product-page views, first-time downloads and outreach replies only when available.

### BEFORE CAMPAIGN LINKS APPEAR

Use the real untagged App Store URL. Log the post and time, and mark source attribution unavailable. A same-day download spike is an association, not proof that a particular post caused it.

### WHEN APPLE DATA IS AVAILABLE

Generate campaign links in App Store Connect rather than guessing app IDs or provider tokens. New apps may need live download data first. Small metrics can be withheld under reporting thresholds; blank or unavailable is not zero.

## The 45-minute weekly review

- Compare the same date range and metric definitions across channels.
- Read voluntary feedback: what did people save, and could they find it again? Ask for a description, not their private content.
- Choose one useful demo to repeat and one unclear claim to improve.
- No in-app analytics means product activation and continued use are not measured by this plan. Do not report inferred retention as a fact.

Apple's campaign guide describes first-time download attribution within 24 hours and last-link credit when multiple campaign links are used. Recheck the current definitions. Native platform views/clicks and Apple metrics can have different scopes.

# Ready when the release is.

Begin with the checklist, then one film, one community and a few relevant conversations.

## Use the package in this order

- 01\_Launch\_Playbook: complete the launch checklist, follow the calendar and keep the tracker honest.
- 02\_Copy: fill every owner/live-link field; adapt to current channel requirements. All messages are unsent drafts.
- 03\_Graphics + 04\_Video: use the right aspect ratio, actual app views and truthful media labels.
- 05\_Landing\_Page: review the local page and replace its destinations before hosting.
- 06\_Source + 07\_QA: retain source/provenance and verify current exports before reuse.

## The claim gate

Free price must match the live listing. Search covers supported saved DaBin content, not the whole Mac. Optional manual-link previews can contact websites. DaBin does not separately encrypt its archive. Do not invent Apple featuring, accessibility evaluation, permanent pricing, founder story or measured time savings.
